TITLE LTA HYDROLASE INHIBITORS

Field of the Invention

5

10

This invention relates generally to anti-inflammatory compounds and pharmaceutical compositions, and more particularly to anti-inflammatory compounds and compositions which are capable of inhibiting leukotriene A4 hydrolase.

Background of the Invention

LTA, hydrolase is a requisite enzyme in the biosynthetic pathway leading to LTB, formation. LTB, is a proinflammatory compound. R. Lewis, et al., N. Engl. J. Med. 323, 645-655 (1990) have demonstrated that LTB, is a potent granulocyte agonist inducing chemotaxis, aggregation, degranulation, adherence and priming of inflammatory cells for induction by other agonists. Binding of LTB, to receptors is stereospecific with two distinct classes of binding sites. A. Lin, et al., Prostaglandins 28, 837-849 (1984). A high affinity site [4-5x10-10 M] mediates chemotaxis and chemokinesis while lower affinity sites [0.6-5x10-7 M] stimulate

- 2 -

granular secretion and oxidative burst. The LTB4 receptor is associated with a GTP-binding protein that regulates affinity and transduces signals. T. Schepers, et al., J. Biol. Chem. 267, 159-165 (1992). Elevated LTB4 levels have been reported for many diseases. Most 5 prominently, elevated LTB4 levels have been correlated to the pathology of inflammatory bowel disease (IBD) including Crohn's disease and ulcerative colitis and in psoriasis. P. Sharon, et al., Gastroent. 86, 453-460; K. Lauritsen, et al., Gastroent. 95, 11-17 (1989); S. 10 Brain, et al., Br. J. Pharm., 83, 313-317 (1984). Other properties of LTB4 which may contribute to disease processes are: stimulation of mucus secretion; stimulation of cytokine production; and the ability to act synergistically with other inflammatory mediators 15 such as prostaglandins and cysteinyl leukotrienes thereby amplifying the inflammatory process.

B. Samuelsson, et al., J. Biol Chem., 264, 19469-19472

(1989) have shown that LTB4 biosynthesis from arachidonic acid involves the action of 2 enzymes, 5-lipoxygenase [5-LO] and LTA4 hydrolase. 5-LO transforms arachidonic acid to 5-HPETE and subsequent formation of LTA4, which is an unstable allylic epoxide intermediate which is enzymatically hydrolyzed by LTA4 hydrolase to form the dihydroxy acid LTB4.

LTA4 hydrolase is distinct from cytosolic and microsomal epoxide hydrolases based on strict substrate

requirements, product formation [5(S),12(R) vs.
5(S),6(R)] for mouse liver cytosolic epoxide hydrolase, and lack of inhibition by inhibitors of cytosolic epoxide hydrolase. LTA4 hydrolase appears to be ubiquitously distributed in mammalian tissues even in cell types that do not express 5-LO, suggesting the importance of transcellular metabolism of LTA4. While peptidomimetic compounds such as bestatin and captopril

WO 98/40364

have been shown to exhibit LTA, hydrolase inhibitory activity, they are not able to satisfy the requirement of a small organic compound which is capable of cellular penetration. It would therefore be very advantageous to be able to provide low molecular weight inhibitors of LTB, biosynthesis which preferably exhibit oral activity in vivo at desirably low concentrations.

Summary of the Invention

10

5

Applicants have now discovered that compounds having the structure:

$$A \longrightarrow O \longrightarrow (CH_2)_n \longrightarrow R^1$$

and pharmaceutically acceptable salts and stereoisomers thereof possess LTA, hydrolase inhibitor activity wherein

A is or
$$q$$

wherein represents a single or double bond

q is 1 or 2, and

Y is -O-, -S-, -CH₂-, or -CH-

B is -O-, $-CH_2-$ or $-CH_2O-$

n is an integer from 2 to 4

25 R^1 is H or C_1 to C_4 alkyl

 R^2 is $(CH_2)_m$ R^3 wherein m is an integer from 1 to 3

 R^3 is CO_2R^4

R4 is H alkyl, amino, alkylamino, dialkylamino

or NR¹R² is combined to form

20

25

$$-N$$
 or $-N$ $(CH_2)_{\tilde{p}}R^3$

wherein r is 1 or 2, p is 0 to 3 and \mathbb{R}^3 is as defined above.

Detailed Description

In one of its embodiments, the present invention entails compounds having the structure:

$$A \longrightarrow O \longrightarrow (CH_2)_n \longrightarrow N$$

and pharmaceutically acceptable salts and stereoisomers thereof, wherein A, B, R^1 , R^2 , and n are as defined above.

The compounds of the present invention, in several embodiments, may comprise a carboxylic acid or ester moiety. It will be appreciated by those of ordinary skill in the art that a compound of the present invention comprising an ester moiety is readily converted, in vivo, especially when administered orally, into its corresponding carboxylic acid form. The ester-containing compounds of the present invention are therefore prodrugs of their carboxylic acid form.

In another of its aspects, the invention entails pharmaceutical composition comprising a pharmacologically effective amount of at least one of

- 5 -

the compounds defined above and a pharmaceutically acceptable carrier.

In still another of its embodiments the present invention involves a method for treating a mammal exhibiting an LTB4 mediated inflammatory condition comprising administering to the mammal a pharmacologically effective amount of a compound of the invention.

10

25

5

The term "lower alkyl" means straight or branched chain alkyl having 1 to 6 carbon atoms such as methyl, ethyl, propyl, butyl, pentyl, hexyl and the branched chain isomers thereof. The term "lower alkoxy" means straight or branched chain alkoxy having 1 to 6 carbon atoms such as methoxy, ethoxy, propoxy, butoxy, pentoxy, hexoxy and the branched chain isomers thereof. The term "allyl" as used herein means the 1-propenyl radical, -CH₂-CH₂=CH₂. The term "halo" or "halogen" means fluoro, chloro, bromo, or iodo.

Included within the classes and subclasses of compounds embraced by this invention are isomeric forms of the described compounds including diastereoisomers, enantiomers and tautomeric forms of the described compounds. Pharmaceutically acceptable salts of such compounds are also included as well as pharmaceutically acceptable salts of such isomers and tautomers.

In the structures disclosed herein a bond drawn across a bond in a ring indicates that the bond can be to any available atom of the ring structure.

The expression "pharmaceutically acceptable salts" is intended to include those salts capable of being formed with the compounds of the present invention without materially altering the chemical structure or

- 6 -

pharmacological properties thereof. Such salts can be inorganic and organic cations or acid addition salts, including, but not limited to sodium, potassium, calcium, ammonium, alkylammonium, quaternary ammonium, triethanolamine, lysine, hydrochloride, hydrobromide, and others well known to those of ordinary skill in the art. The foregoing salts are prepared in the conventional manner by neutralization of the compounds of this invention with the desired base or acid.

10

15

20

25

30

35

5

The compounds of the present invention can be administered to a subject in such oral dosage forms as tablets, capsules, pills, powders, granules, elixirs or syrups, as well as aerosols for inhalation. Likewise, administration may be effected intravascularly, subcutaneously, or intramuscularly using dosage forms known to those of ordinary skill in the pharmaceutical In general, the preferred form of administration is oral. An effective but non-toxic amount of the compound is employed in treatment. The dosage regimen utilizing the present compounds is selected in accordance with a variety of factors including the type, age, weight, sex and medical condition of the patient; the severity of the condition to be ameliorated; and the route of administration. A physician of ordinary skill can readily determine and prescribe a "pharmaceutically effective amount" of at least one of the compounds defined above, that is, the effective amount of the compound required to prevent, treat or arrest the progress of the condition. Dosages of the compounds of the present invention will range generally between 0.1 mg/kg/day to about 100 mg/kg/day and preferably between about 0.5 mg/kg/day to about 50 mg/kg/day when administered to subjects suffering from allergic or hypersensitivity reactions or inflammation. The compounds may also be administered transdermally or topically to treat proliferative skin conditions such

- 7 -

as psoriasis. The daily dosage may be administered in a single dose or in equal divided doses, for example, three to four times daily. The subject is typically a mammal and, in particular, a human patient.

5

10

15

20

25

30

35

As used herein the phrase "LTA4 hydrolase inhibitor" means a compound that is capable of exhibiting an IC50 of less than 1 mM in an in vitro assay employing 10 μ g/ml of LTA4 hydrolase enzyme (specific activity 600 nMoles LTB4/min/mg of enzyme) in the presence of 25 μ M substrate (LTA4) in a total reaction volume of 100 μ l.

In the pharmaceutical compositions and methods of the present invention, at least one of the active compounds of the invention or a pharmaceutically acceptable salt thereof will typically be administered in admixture with suitable pharmaceutical diluents, excipients or carriers (collectively referred to herein as "carrier materials") suitably selected with respect to the intended form of administration and consistent with conventional pharmaceutical practices. For example, the pharmaceutical compositions of this inventio ncan be administered as oral tablets, capsules, elixirs, syrups and the like For oral administration in the form of tablets or capsules, the active drug component may be combined with any oral non-toxic pharmaceutically acceptable inert carrier such as lactose, starch, sucrose, cellulose, magnesium stearate, dicalcium phosphate, calcium sulfate, mannitol and the like; for oral administration in liquid form, the active drug component may be combined with any oral non-toxic pharmaceutically acceptable inert carrier such as ethanol and the like. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents and coloring agents can also be incorporated in the mixture. Suitable

binders include starch, gelatin, natural sugars, corn

- 8 -

sweeteners, natural and synthetic gums such as acacia, sodium alginate, carboxymethylcellulose, polyethylene glycol and waxes. Lubricants for use in these dosage forms include boric acid, sodium benzoate, sodium acetate, sodium chloride and the like. Disintegrators include, without limitation, starch, methylcellulose, agar, bentonite, guar gum and the like.

5

By virtue of their activity as LTA, hydrolase inhibitors, the compounds of the invention are useful 10 in treating inflammatory conditions mediated by LTB4 production in mammals such as psoriasis, contact and atrophic dermatitis, Crohn's disease, ulcerative colitis, inflammatory bowel disease, multiple sclerosis, ankylosing spondylitis, arthritis, asthma 15 and the like. Similarly, the compounds of the invention can be used in preventing recurring inflammatory attacks. A physician or veterinarian of ordinary skill can readily determine whether a subject 20 exhibits the inflammatory condition. A preferred utility relates to treatment of ulcerative colitis.

The compounds of the invention are prepared from readily available starting materials by any of the following alternate processes in a conventional manner. The following reaction schemes describe methods which can be employed for preparing the compounds of the invention including starting materials, intermediates and reaction conditions. The following terms, as used herein, have the following definitions:

NMMO N-methylmorpholine-N-oxide
Me methyl
SitBuMe₂ t-butyldimethylsilyl
n-butyllithium

Example 1

5

15

(a) A mixture of 4-iodobenzonitrile (5.06 g, 22 mmol), 4-methoxyphenol (2.72 g, 22 mmol), potassium carbonate (3.182 g, 22 mmol), and copper bronze (1.39, 22 mmol) in pyridine (120 ml) was heated to reflux 10 under argon for 4 days. The reaction was allowed to cool to room temperature and concentrated in vacuo. The brown residue was acidified to pH = 1 with concentrated HCl and diluted with water. The mixture was extracted with EtOAc (2X) and the organic layers The organic layer was dried over MgSO4 and concentrated in vacuo to give a black/brown solid (4.56 g). The solid was purified by column chromatography (5% EtOAc/hexane followed by 10% EtOAc/hexane) to give a white solid (1.8 g). NMR spectrum is consistent with 20 structure (a) above.

(b) A mixture of fused ZnCl₂ (0.782 g, 5.3 mmol), the compound from step a (0.548 g, 2.2 mmol), and ethanolamine (15 ml) was heated to 130-140°C for 4 hours The reaction was diluted with CH₂Cl₂, and washed with water (2X) and brine. The organic layer was collected and dried over MgSO₄. Concentration in vacuo gave a white solid (0.71 g). The solid was purified by column chromatography (100 g silica gel, 5% MeOH/CH₂Cl₂ (500 ml)) gave the desired product as a white solid (0.29 g). NMR spectrum is consistent with structure (b) above.

(c) A mixture of the compound of step b (0.149 g, 0.59 mmol) and NiO₂ (0.838 g, 8.9 mmol) in benzene (10 ml) was heated to reflux for 17 hours. The reaction was allowed to cool to room temperature and filtered through celite. Concentration of the filtrate gave a white solid (0.10 g). NMR spectrum is consistent with structure (c) above.

- 15 -

Example 2

A mixture of 4-cyanophenol (1.856 g, 15.4 mmol) and 5 potassium hydroxide (0.868 g, 14.1 mmol) was heated to 140°C under argon. The resulting solution resolidified within 15 min. of heating. At this time, 4-iodoanisole (3.039 g, 12.8 mmol) was added followed by activated Cu (0.277 g) and the reaction mixture was heated to 170°C 10 for 20 hours. The reaction was allowed to cool to room temperature and 10% NaOH added. The mixture was extracted with Et₂O (4 X 75 ml). The organic layers were collected, washed with brine and dried over MgSO4. Concentration in vacuo gave a red/brown oil (0.68 g). 15 The oil was purified by column chromatography (50 g silica gel; 5% EtOAc/hexane followed by 10% EtOAc/hexane) to give the product as a pale yellow solid (0.140 g). NMR spectrum is consistent with the 20 structure above.

Example 3

25

The procedures described in Example 2 were repeated using 4-phenylphenol (4.366 g, 25.6 mmol) in place of 4-cyanophenol, and 4-iodoanisole (5.053, g, 21.4 mmol). The reaction was heated to 200°C for 3.5 hours. After

work-up, a pale yellow solid was collected. The solid was recrystallized from MeOH to give the desired product (1.03 g). NMR spectrum is consistent with the structure above.

5

Example 4

A solution of the compound of Example 1 (0.08 g, 0.3 10 mmol) in CH_2Cl_2 (2 Ml) was cooled to -78°C. A 1 M solution of BBr₃ in CH₂Cl₂ (0.66 ml) was added slowly under argon. The reaction was allowed to warm slowly to room temperature over 1.5 hours. The reaction was concentrated in vacuo and a mixture of water and CH2Cl2 15 was added to the residue. The organic layer was collected and washed with brine. Concentration in vacuo gave a brown oil (0.079 g). The oil solidified upon standing at room temperature. The solid was slurried with CH₂Cl₂ (3-5 ml) and the undissolved solid 20 was collected by vacuum filtration to give a grey solid (0.047 g). NMR spectrum is consistent with the structure above.

25

- 17 -

Example 5

The procedures described in Example 4 were repeated using the compound of Example 2 (0.259 g, 1.2 mmol) in place of the compound of Example 1. After work-up, a blue solid was obtained as the desired product (0.262 g). NMR spectrum is consistent with the structure above.

Example 6

The procedures described in Example 4 were repeated using the compound of Example 3 (1.03 g, 3.7 mmol) in place of the compound of Example 1. Upon work-up, the desired product was obtained as a white solid (0.887 g). NMR spectrum is consistent with the structure above.

Example 7

15

25

WO 98/40364

5

10

15

A mixture of the compound of Example 4 (0.04g, 0.16 mmol), potassium carbonate (0.120 g, 0.79 mmol), and 1-(2-chloroethyl)pyrrolidine hydrochloride (0.037 g, 0.19 mmol) in DMF (3 ml) was heated to 80°C (bath). After 21 hours of heating, the reaction was allowed to cool to room temperature and diluted with EtOAc (20 ml). The resulting solution was washed with water (2 X 20 ml) and brine (20 ml). The organic layer was collected, dried over MgSO₄, and concentrated in vacuo to give a white/yellow solid (0.04 g). The solid was purified by plate chromatography (5% MeOH/CH₂Cl₂) to give the desired product as a tan solid (0.022 g). Anal. calc'd for C₂₁H₂₂N₂O₃ + 0.2 H₂O: C, 71.25; H, 6.38; N, 7.91. Found: C, 71.03; H, 5.98; N, 7.80. M*=350.

Example 8

The procedures described in Example 7 were repeated using the compound of Example 6 (0.360 g, 1.4 mmol) in place of the compound of Example 4. After work-up, a yellow/white solid was obtained. The solid was further purified by slurrying with MeOH to give a cream-colored solid as the desired product (0.202 g). Anal. calc'd for C₂₄H₂₅NO₂ + 0.2 H₂O: C, 79.40; H, 7.05; N, 3.86. Found: C, 79.65; H, 7.11; N, 3.84. MH*=360.

- 19 -

Example 9

The procedures described in Example 7 were repeated using the compound of Example 5 (0.262 g, 1.2 mmol) in place of the compound of Example 4. After work-up, a yellow/brown oil was obtained as the desired product (0.260 g). NMR spectrum is consistent with the structure above.

Example 10

15

20

The procedures described in step b of Example 1 were repeated using the compound of Example 9 (0.087 g, 0.28 mmol) in place of the compound of Example 1 step a. After work-up, a yellow/white solid was obtained. The solid was further purified by column chromatography (95 CHCl₃: 5 EtOH: 0.5 NH₄OH) to give the desired product as a white solid (0.06 g). Anal. calc'd for $C_{21}H_{24}N_2O_3 + 0.3H_2O$: C, 70.49; H, 6.93; N, 7.83. Found: C, 70.48; H, 7.02; N, 7.77. MH'=353.

- 20 -

Example 11

5

10

15

(a) To a solution of the compound of Example 6 (0.411 g, 1.6 mmol) in DMF (5 ml) was added ethylene carbonate (0.255 g, 2.9 mmol) and nBu4NBr (0.108 g, 0.31 mmol) under argon. The reaction was heated to 140-150°C (bath). After 8 hours, additional ethylene carbonate (0.041 g) was added to the reaction. The reaction was stirred at 140-150°C for an additional 16 hours before concentrating the reaction in vacuo. The resulting residue was dissolved in CH2Cl2 and washed with brine. The organic layer was collected, dried over MgSO4, and concentrated in vacuo to give a light tan solid (0.570 g). The solid was recrystallized from EtOAc to give the desired product (0.210g). NMR spectrum is consistent with the structure (a) above.

20

WO 98/40364

25

- 21 -

PCT/US98/03926

A mixture of the compound from step a (0.085 (b) g, 0.28 mmol) and TsCl (0.074 g, 0.36 mmol) in CH_3CN 5 (1.5 ml) was cooled to 0°C. Triethylamine (0.15 ml, 1.1 mmol) was then added neat under argon. reaction was allowed to stir at 0°C for 5 min. before removing the ice bath. The reaction was stirred at room temperature for 22 hours and then quenched with 10 water. The resulting mixture was filtered and the desired product was collected as a tan solid. The solid was rinsed with CH₃CN/water (3:7) then allowed to air dry to give 0.107 g. The product was combined with 5 other previous runs and purified by column 15 chromatography (3:1 hexane/EtOAc) to give the desired product as a white solid (0.142 g). NMR spectrum is consistent with the structure (b) above.

(c) To a solution of the compound from step b (0.142 g, 0.3 mmol) in DMF (1.5 ml) was added ethyl isonipecotate (0.05 ml, 0.3 mmol) followed by potassium carbonate (0.220 g, 1.5 mmol). The reaction mixture was heated to 80°C (bath) under argon for 19.5 hours. The reaction was concentrated in vacuo and the residue was diluted with water (20 ml). The mixture was

- 22 -

extracted with EtOAc (2 X 35 ml). The organic layers were combined, washed with brine, and dried over MgSO₄. Concentration in vacuo gave a white/yellow solid (0.134 g). The solid was purified by column chromatography (50 g silica gel, 1:1 EtOAc/hexane followed by 2:1 EtOAc/hexane) to give the desired product as a white solid (0.063 g). Anal. calc'd for C₂₈H₃₁NO₄: C, 75.48; H, 7.01; N, 3.14. Found: C, 75.28; H, 7.07; N, 3.09. M*=445.

10

5

Example 12

To a solution of the compound of Example 11 in distilled THF (5 ml) was added 6 M HCl. The reaction was heated to 85-95°C for 2 hours. The reaction was then concentrated in vacuo to give a white solid. The solid was purified by slurrying with ether. A white solid was collected by vacuum filtration (0.014 g). Anal. calc'd for C₂₄H₂₅NO₂ + 3.0 HCl + 1.0 H₂O: C, 57.31; H, 5.92; N, 2.57. Found: C, 57.37; H, 6.02; N, 2.25. M+=417.

25

- 23 -

Example 13

5

(a) To a solution of the compound of Example 6 (0.350 g, 1.3 mmol) in methyl ethyl ketone (4 ml) was added potassium carbonate (0.937 g, 6.7 mmol) followed 10 by bromochloropropane (0.13 ml, 1.3 mmol) under argon. The resulting mixture was heated to 85-90°C (bath) for 21.5 hours, then heated to 95°C for 1.5 hours. reaction was poured into a separatory funnel containing water (25 ml) and extracted with EtOAc (2 X 40 ml). 15 The organic layers were combined, washed with brine, dried over MgSO4, and concentrated in vacuo to give a yellow/white solid (0.442 g). The solid was purified by column chromatography (75 g silica gel, 5:1 hexane/EtOAC (500 ml)) to give the desired product as a white solid (0.324g). NMR spectrum is consistent with 20

structure (a) above.

(b) To a mixture of the compound from step a (0.324 g, 0.96 mmol) in CH_3CN (6 ml) was added H_2NMe (8 ml, 95.6 mmol). Upon addition of H_2NMe , a white solid 5 precipitated out of the mixture. The mixture was heated to 55°C (bath) for 8.5 hours. At this time, additional H_2NMe (2 ml) was added to the reaction. The reaction was stirred for another 16 hours at room temperature then heated to 55°C for 3 hours. 10 The reaction was concentrated in vacuo and extracted with EtOAc (2 X 20 ml). The organic layer was collected, cooled to O°C, and acidified to pH 1 with 6 M HCl. At this point, no solid was observed to precipitate out of solution. The solution was therefore basified to pH 12 15 with 10% NaOH and extracted with EtOAc (2 X 50 ml). The organic layer was collected and dried over MgSO4. Concentration in vacuo gave a white solid. was slurried with EtOAc and collected by vacuum 20 filtration as the desired product (0.224 g). spectrum is consistent with the structure (b) above.

25 (c) To a solution of the compound of step b (0.224 g, 0.70 mmol) in CH_2Cl_2 (2 ml) was added methyl acrylate (0.08 ml, 0.91 mmol). The reaction was stirred at room temperature over 48 hours. At this time, additional

- 25 -

methyl acrylate was added (0.04 ml) to the reaction. The reaction was stirred for another 3 hours, then concentrated under a stream of N_2 to give a white/yellow solid. The solid was purified by column chromatography (50 g silica gel, 10% MeOH/CH₂Cl₂ to give the desired product as a white solid (0.200 g). Anal. calc'd for $C_{26}H_{29}NO_4$: C, 74.44; H, 6.97; N, 3.34. Found: C, 74.11; H, 6.85; N, 3.21. M^* =419.

10 Example 14

5

20

The compound of Example 13 (0.1 g) was treated with 6 M HCl under the same reaction conditions as those described in Example 12 to give the desired product as a white solid (0.073 g). C₂₅H₂₈NO₄ + 1.0 HCl + 0.8 H₂O: C, 65.80; H, 6.54; N, 3.07. Found: C, 65.71; H, 6.25; N, 2.81. MH⁺=406.

Example 15

25 200 mL of 2N ethylamine in methanol (0.4 mol), 10 mL (0.15 mol) acrylonitrile and 35 mL (0.25 mol) triethylamine were stirred in 100 mL methanol at 25°C for 21 hours. The mixture was concentrated and used without further purification. This was stirred in 70

- 26 -

mL DMF with 44 mL (0.44 mol) 1-bromo-3-chloropropane and 25 mL (0.18 mol) triethylamine at 40°C for 5 hours and at 25°C for 15 hours. The mixture was poured into water and ether and the ether layer was washed with 2N HCl. The acid layer was washed with ether, made basic (>pH 10) with 45% KOH and extracted twice with ether. The ether extracts were dried over $\rm Na_2SO_4$ and concentrated to provide the desired compound (21.7 g, 0.124 mol) as a colorless oil: $^1{\rm H}$ NMR (CDCl₃) δ 1.04 (t,3H), 1.88 (m, 2H), 2.40-2.65 (m, 6H), 3.65 (t, 2H).

5

10

15

Example 16

The compound was prepared as described for Example 15, using a solution of methylamine in place of ethylamine.

Example 17

(a) To a suspension of the product from Example 2 (10.0 g, 44 mmol) in t-butanol (80 mL) was added 30 mL dimethylsulfoxide (DMSO) and powdered KOH (9.1 g, 162

- 27 -

WO 98/40364

5

mmol). The mixture was heated at reflux for 2 hours. The mixture was cooled and diluted with water (100 mL). The white solid precipitate was collected by filtration and washed with water (4 X 150 mL). The solid was dried in vacuo to give 9.6 g (89%) of (a): mp 195-196°C.

PCT/US98/03926

(b) To a suspension of the compound from step (a) (4.2 g, 17.3 mmol) in toluene (80 mL) was added Lawesson's reagent (7.0 g, 17.3 mmol). The mixture was heated at reflux for 3 hours, cooled and concentrated in vacuo. The residue was chromatographed on silica gel (1:1 hexane/ethyl acetate) to give 2.2 g (49%) of (b).

$$(c)$$
 S OMe

(c) A mixture of oxalic acid (590 mg, 6.5 mmol) and chloroacetaldehyde dimethyl acetal (0.75 mL, 6.5 mmol) was heated at reflux for 1 hour. The oil bath was removed for 10 minutes and the compound from step (b) (1.7 g, 6.5 mmol) was added. The resulting mixture was heated at reflux for 2 hours. The mixture was cooled to room temperature and 30% HCl (3.5 mL) was added. The mixture was heated at reflux for 10 minutes, cooled and diluted with water. The reaction mixture was extracted with CH₂Cl₂ (3 X 10 mL). The organic solution was dried (Na₂SO₄) and concentrated in vacuo. The

to give the 925 mg (50%) of (c) as a crystalline solid: mp 92-93 °C; Anal. calcd for $C_{16}H_{13}NO_2S$: C, 67.82; H, 4.62; N, 4.94. Found: C, 67.66; H, 4.50; N, 4.86.

10

(d) To a solution of the compound from step (c) (280 mg, 1.0 mmol) in $\mathrm{CH_2Cl_2}$ (3 mL) at -78°C was added boron tribromide (1.8 mL of a 1M solution in $\mathrm{CH_2Cl_2}$). The solution was kept at -78°C for 1 h and then warmed to room temperature over 2 hours. The reaction solution was diluted with water and extracted with $\mathrm{CH_2Cl_2}$ (2 X 20 mL). The combined organic solution was dried (Na₂SO₄) and concentrated in vacuo to give 210 mg (78%) of (d).

15 (e)
$$N \longrightarrow N \longrightarrow CN$$

(e) To a suspension of powdered KOH (63 mg, 1.1 mmol) in DMSO (1 mL) as added via canula a solution of the compound from step (d) (200 mg, 0.74 mmol) in DMSO (2 mL). The mixture was stirred at room temperature for 5 min and the product of Example 16 (118 mg, 0.74 mmol) in DMSO (1 mL) was added via canula. The reaction mixture was heated at 45°C for 4 hours. The mixture was cooled to room temperature and partitioned between water and ether (15 mL). The aqueous solution was extracted with ether (2 X 10 mL). The combined organic solution was dried (Na₂SO₄) and concentrated in vacuo.

The residue was chromatographed (ethyl acetate) to give

- 29 -

112 mg (39%) of (e) as a crystalline solid: mp 63-64 °C.

$$(f) \qquad S \qquad CO_2H$$

(f) A solution of the compound from step (e) (100 mg, 0.25 mmol) in 6N HCl (2 mL) was heated at 90°C for 17 hours. The solution was cooled to room temperature and brought to pH 8 with 10% NaOH. The aqueous solution was extracted with CH₂Cl₂ (3 X 15 mL). The organic solution was concentrated in vacuo. The residue as chromatographed on silica (85:14:1 CH₂Cl₂/MeOH/NH₄OH) to give 40 mg (39%) of (f) as a crystalline solid: mp 143-144°C.

15

Example 18

The product from Example 4 (434 mg, 1.7 mmol), the product from Example 16 (305 mg, 1.9 mmol) and powdered KOH (158 mg, 2.8 mmol) were stirred in 20 mL DMF at 50°C for 12 hours. The mixture was cooled and diluted with 75 mL H₂0. The aqueous base was separated and extracted with 3 X 25 mL methyl t-butyl ether (MTBE). The combined organic phases were dried (MgSO₄) and concentrated to afford the crude product as a brown oil. The crude nitrile was dissolved in 5 mL MTBE and 5 mL concentrated HCl was added. The MTBE was

5

10

20

30

distilled from the reaction and an additional 2 mL concentrated HCl was added. The reaction was heated to 95°C for 24 hours. After cooling, the mixture was diluted with 50 mL $\rm H_20$ and neutralized with a saturated NaHCO₃ solution. The aqueous phase was extracted with 4 X 15 mL $\rm CH_2Cl_2$ and the extracts dried (MgSO₄) and concentrated to afford a yellow oil. The oil was dissolved in 1 mL methanol and 3M ethanolic HCl was added until a precipitate formed. The tan solid was filtered and dried: Anal. calcd for $\rm C_{22}H_{24}N_2O_5 \bullet 1.5~HCL \bullet 1.0~H_2O$: C. 56.32; H, 5.91; N, 5.97; Cl, 11.34. Found: C, 56.61; H, 5.75; N, 5.32; Cl, 11.55.

Example 19

$$\begin{array}{c} O \\ O \\ O \\ \end{array} \begin{array}{c} O \\ \end{array} \begin{array}{c} CO_2H \\ \end{array}$$

The above compound was prepared in the same manner as Example 18 substituting the product from Example 15 in place of the product of Example 16. The HCl salt was isolated as a tan solid: Anal. calcd for $C_{23}H_{26}N_2O_5 \circ 1.25$ HCl \circ 1.0 H_2O : C, 58.27; H, 6.22; N, 5.91; Cl, 9.35. Found: C, 58.16; H, 6.25; N, 5.26; Cl, 9.14.

25 <u>LTA Hydrolase Methods</u>

The following Table presents data demonstrating the pharmacological activity of the LTA hydrolase inhibitors of the present invention. One or more of three different assays, (1) an in vitro LTA hydrolase enzyme assay, (2) a human whole blood assay utilizing calcium ionophore stimulation, and (3) a murine ex vivo assay utilizing calcium ionophore stimulation were

- 31 -

employed to determine the level of LTA hydrolase inhibitor activity.

Recombinant Human LTA Hydrolase Assay for LTA Hydrolase
5 Inhibitor Activity

Compounds of the present invention were tested for LTA hydrolase inhibitor activity against recombinant human LTA hydrolase (rhLTAH). Recombinant human LTA hydrolase-encoding vectors were prepared and used to 10 express rhLTAH essentially as described by J. Gierse, et al., Protein Expression and Purification, 4, 358-366 (1993). Briefly, LTA hydrolase encoding DNA was amplified by polymerase chain reaction using a pair of oligonucleotide primers based on the nucleotide 15 sequence from the 5'-end, and the complement of the 3'end, of the coding region of the LTA hydrolase gene, the nucleotide sequence of which gene is known. C. Funk, et al., Proc. Natl. Acad. Sci. USA 84, 6677-6681 (1987)). A λgt11 human placental cDNA library 20 (Clonetech, Palo Alto, CA) provided the nucleic acid template. The LTA hydrolase encoding region had a length of about 1.9 kb. The amplified 1.9 kb DNA was isolated and cloned into the genomic baculovirus, 25 Autographa californica nuclear polyderosis virus (ACNPC) DNA, and the baculovirus expression vector was transfected into Spodoptera frugiperda Sf-9 cells employing the calcium phosphate co-precipitation method (see, M. Summers, et al., Tex. Agric. Exp. Stn. Bull. 30 1555, 1-57 (1987). Recombinant LTA4 hydrolase enzyme was purified from the transfected Sf-9 cells essentially as described by J. Gierse, et al., supra.

One or more predetermined amounts of a compound of the invention were incubated in assay buffer (0.1 M potassium phosphate, 5 mg/ml fatty acid free BSA, 10% DMSO, Ph 7.4) for 10 minutes at room temperature with

- 32 -

250 ng of recombinant hLTA4H to allow binding, if any, between the enzyme and inhibitor. The stock enzyme solution was 1 mg/m. LTA4 hydrolase, 50 Mm Tris, Ph 8.0, 150 Mm NaCl, 2.5 Mm beta-mercaptoethanol, 50% glycerol. The specific activity of the enzyme was 5 about 650 Nmoles/min/mg. LTA4 (i.e., substrate) was prepared from the methyl ester of LTA4 (Biomol, Inc., Plymouth Meeting, PA) by treating the methyl ester with 30 molar equivalents of LiOH at room temperature for 18 hours. The LTA4 substrate in its free acid form was 10 kept frozen at -80°C until needed. LTA4 (free acid) was thawed and diluted in assay buffer (minus DMSO) to a concentration of 350 ng/ml and 25 μ l (8ng) of LTA₄ substrate was added to the reaction mixture (total 15 volume of reaction mixture = 200 μ l at time zero. Each reaction was carried out at room temperature for 10 The reaction was stopped by diluting 25 μ l of the reaction mixture with 500 μ l of the assay buffer without DMSO. LTA4 was quantified in the diluted sample by a commercially available enzyme-linked immunoassay 20 [Caymen Chemical Col. Ann Arbor, MI] using the method recommended in the manufacturer's instructions and compared to the amount of LTA4 produced in a negative control (i.e., essentially identical conditions except without addition of an inhibitor compound). The IC50 25 was routinely calculated from the data produced.

LTB, and Thromboxane Production by Calcium Ionophore Stimulated Human Blood for LTB, Hydrolase Inhibitor Activity

30

35

Human blood, collected in heparin-containing Vacutainer tubes, was diluted 1:4 with RPMI-1640 media and 200 μ l of the diluted blood was added into each of a 96-well microtiter plate. One or more concentrations of the leukotriene A4 hydrolase inhibitor compounds being tested were prepared (diluted in DMSO) and 2 μ l added

and gently mixed with the diluted whole blood. After incubating for 15 minutes at 37°C in a humidified incubator, calcium ionophore Al3187 (Sigma Chemical Co., St. Louis, MO) was added to a final concentration of 20 mcg/ml and the incubation continued under the same conditions for an additional 10 minutes to allow LTB4 formation. The reaction was terminated by centrifugation (833 g, 10 minutes at 4°C) and supernatant were analyzed for LTB4 and thromboxane by commercially available enzyme-linked immunoassays (Caymen Chemical Co., Ann Arbor, MI) according to the manufacturer's instructions. The IC₅₀ of each test compound was determined from the amount of inhibition of LTB4 production as compared to an essentially identical assay in which no inhibitor compound was present.

15

20

25

30

35

Ex Vivo LTB, and Thromboxane Production by Calcium Ionophore Stimulated Mouse Blood for LTB, Hydrolase Inhibitor Activity

Leukotriene A4 hydrolase inhibitor compounds of the present invention were diluted to a predetermined concentration in phosphate buffered saline containing 2% DMSO and 1% Tween 80. The compounds were administered by oral gavage to adult male outbred mice weighing approximately 20-30 gm at a dose of 10 mg/kg body weight. (Compounds given at a dose of 50 mg/kg body weight are designated in following Table by the symbol, *) Sixty (60) minutes after administration of an LTA, inhibitor compound of the invention, blood was collected (into heparin-containing tubes) from the retroorbital sinus. The heparinized blood was added to the wells of a microtiter plate along with an equal volume of RPMI-1640 media, and calcium ionophore A23187 was added to a final concentration of 20 mcg/ml. The mixture was incubated for 10 minutes at 37°C in a

- 34 -

humidified incubator. The reaction was terminated by centrifugation (833 g. 10 minutes at 4°C). Supernatant were analyzed for LTB4 and thromboxane by commercially available enzyme-linked immunoassays [Caymen Chemical Co., Ann Arbor, MI] in accordance with the manufacturer's instructions. The percent inhibition was determined by comparison to animals treated identically except that the solution administered by oral gavage was devoid of inhibitor compound.

What is claimed is:

1. A compound having the structure:

$$A \longrightarrow O \longrightarrow (CH_2)_n \longrightarrow N$$

wherein:

wherein represents a single or double bond;

q is 1 or 2, and

Y is -O-, -S-, -CH- or -CH₂-

B is -O-, $-CH_2$ - or $-CH_2O$ -

n is 2 to 4

R1 is H or C1 to C4 alkyl

 R^2 is $(CH_2)_m$ R^3 wherein m is 1 to 3

 R^3 is CO_2R^4

 R^4 is H, alkyl, amino, alkylamino, dialkylamino; or NR^1R^2 is combined to form

wherein r is 1 or 2, p is 0 to 3 and R^3 is as defined above.

- 2. The compound of claim 1 wherein B is O.
- 3. The compound of claim 2 wherein A is phenyl.

4. The compound of claim 2 wherein A is

- 5. The compound of claim 2 wherein Y is -O- and q is 1.
- 6. The compound of claim 2 wherein NR^1R^2 is combined to form

7. The compound of claim 1 having the structure:

8. The compound of claim 1 having the structure:

9. The compound of claim 1 having the structure:

10. The compound of claim 1 having the structure:

11. The compound of claim 1 having the structure:

12. The compound of claim 1 having the structure:

13. The compound of claim 1 having the structure:

14. The compound of claim 1 having the structure:

15. The compound of claim 1 having the structure:

16. The compound of claim 1 having the structure:

17. A pharmaceutical composition comprising compound having the structure:

$$A \longrightarrow O \longrightarrow (CH_2)_n \longrightarrow N$$

WO 98/40364

PCT/US98/03926

or a pharmaceutically acceptable salt or stereoisomer thereof, and a pharmaceutically acceptable carrier, wherein

A is or
$$q$$

wherein represents a single or double bond

q is 1 or 2, and

Y is -O-, -S- or -CH-

B is -O-, -CH₂- or -CH₂O-

n is 2 to 4

R1 is H or C1 to C4 alkyl

 R^2 is $(CH_2)_m$ R^3 wherein n is 1 to 3

 R^3 is CO_2R^4

 R^4 is H alkyl, amino, alkylamino, dialkylamino or NR^1R^2 is combined to form

$$-N$$
), $-N$), or $-N$ (CH_2) $_{\bar{p}}R^3$

wherein r is 1 or 2, p is 0 to 3 and \mathbb{R}^3 is as defined above.

- 18. The pharmaceutical composition of claim 17 wherein in the compound B is O.
- 19. The pharmaceutical composition of claim 17 wherein in the compound A is phenyl.
- 20. The pharmaceutical composition of claim 18 wherein in the compound A is

- 21. The pharmaceutical composition of claim 18 wherein in the compound Y is O and q is 1.
- 22. The pharmaceutical composition of claim 18 wherein in the compound NR^1R^2 is combined to form

23. The pharmaceutical composition of claim 17 wherein the compound has the structure:

24. The pharmaceutical composition of claim 17 wherein the compound has the structure:

25. The pharmaceutical composition of claim 17 wherein the compound has the structure:

26. The pharmaceutical composition of claim 17 wherein the compound has the structure:

27. The pharmaceutical composition of claim 17 wherein the compound has the structure:

28. The pharmaceutical composition of claim 17 wherein the compound has the structure:

29. The pharmaceutical composition of claim 17 wherein the compound has the structure:

30. The pharmaceutical composition of claim 17 wherein the compound has the structure:

31. The pharmaceutical composition of claim 17 wherein the compound has the structure:

32. The pharmaceutical composition of claim 17 wherein the compound has the structure:

WO 98/40364

33. A method for treating an LTB_4 -mediated inflammatory disease comprising administering to a mammal in need of treatment a therapeutically effective amount of a compound having the structure:

$$A \longrightarrow O \longrightarrow (CH_2)_n \longrightarrow N$$

or a pharmaceutically acceptable salt or stereoisomer thereof, and a pharmaceutically acceptable carrier, wherein

A is or
$$q$$

wherein represents a single or double bond

q is 1 or 2, and

Y is -O-, -S- or -CH-

B is -O-, $-CH_2-$ or $-CH_2O-$

n is 2 to 4

R¹ is H or C₁ to C₄ alkyl

 R^2 is $(CH_2)_m$ R^3 wherein n is 1 to 3

R³ is CO₂R⁴

R4 is H alkyl, amino, alkylamino, dialkylamino

or NR¹R² is combined to form

$$-N$$
, $-N$, or $-N$, $-(CH_2)_{\bar{p}}R^3$

wherein r is 1 or 2, p is 0 to 3 and \mathbb{R}^3 is as defined above.

- 34. The method of claim 33 wherein in the structure of the compound B is O.
- 35. The method of claim 34 wherein in the structure of the compound A is phenyl.
- 36. The method of claim 34 wherein in the structure of the compound A is

- 37. The method of claim 34 wherein in the structure of the compound Y is O and q is 1.
- 38. The method of claim 34 wherein in the structure of the compound NR^1R^2 is combined to form

39. The method of claim 33 wherein the compound has the structure:

40. The method of claim 33 wherein the compound has the structure:

41. The method of claim 33 wherein the compound has the structure:
